Declaration of incorporation according to EC Machinery Directive 2006/42 / EC, Annex II B

Hereby we declare that the incomplete machine

H2Smart™

Due to its design and construction, as well as in the design it places on the market, as far as the scope of supply allows, it complies with the following basic requirements:

2014/30/EU	Electromagnetic Compatibility Directive
Harmonized standards:	
EN 61000-6-2:2008	Electromagnetic compatibility (EMC) - Part 6-2: Generic standards - Immunity for industrial environments
EN 61000-6-4:2008+A1:2012	Electromagnetic compatibility (EMC) - Part 6-4: Generic standards - Emission standard for industrial environments
EN 50581:2012	Technical documentation for the assessment of electrical and electronic products with respect to the restriction of hazardous substances

2006/95/EC Low-Voltage Directive

EN 61010-1:2011	Safety requirements of electrical equipment for measurement, control and laboratory use. Part1: General requirements

Compliant with 2002/95/EC RoHS Directive
Recycling: per 2002/96/EC W.E.E.E Directive

We declare that the special technical documentation in accordance with Annex VII, Part B has been prepared for this incomplete machine and we undertake to transmit it to the supervisory authorities in digital form on request.

For the purpose of the Machinery Directive 2006/42/EC, the partly completed machinery may not be put into service until it has been determined that the machine in which it is to be installed complies with the provisions of this Directive, provided that this Directive applies to this machinery.

We would like to point out that the following actions may affect the above attested conformity and the characteristics of the product:

- Installation and operating errors or failure to observe the instructions in the operating instructions supplied with the product.
- Replacement of parts or original accessories by unauthorized persons or replacement with parts that are not approved by the manufacturer.

To ensure EMC compliance, the device must always be connected to protective earth. This connection is made via the M12 connector.

AMS Conformity (North America)

This product conforms to SAE Aerospace Material Specifications AMS 2759/10 for nitriding and 2759/12 for nitrocarburizing.

TECHNICAL ASSISTANCE

For all questions or concerns regarding the operation of the **H2SmartTM**, please consult the last page of this manual for contact information.

Table of Contents

Table of Figures

1 INTRODUCTION

The *H2Smart*™ is an integrated thermal conductivity sampling system designed to measure the concentration of a gas sample in binary or quasi-binary mixtures. It is especially suitable to measure hydrogen content or dissociation level with high accuracy in nitriding and nitrocarburizing atmospheres and to calculate the parameters necessary for nitriding process control. A unique measuring cell design and advanced electronics eliminate the need for a reference gas cell, thus simplifying the installation.

It includes an integrated sampling pump with variable output and a flow monitoring circuit with pump saturation warning and flow alarm. The pump provides a continuously controlled flow despite possible sampling line obstructions or filter contaminations, thus assuring accurate measurements and better process control.

The measuring block is maintained at a preset temperature with high accuracy to provide stable measuring conditions and protect the system from moisture formation and cell contamination during nitrocarburizing.

The system status and measured results are displayed on a large, easy to read alphanumerical display.

2 SPECIFICATIONS

2.1 Physical

Width (including mounting bracket):	170 mm / (6.7”)
Height:	190 mm / (7.5”)
Depth:	140 mm / (5.5”)
Weight:	4 kg / (8.8 lbs)
Process Connection:	1/4" Swagelok tubing connector, 6mm adaptor available

2.2 Performance

Accuracy:	+/- 0.5% of reading plus +/- 0.3% of full scale
Linearity:	< 0.5% of full scale
Repeatability:	< 0.5% of full scale
Zero drift:	< 0.5% of full scale per month
Sampling flow:	0.5 lpm / (1 cfh) controlled
Response time:	95% in 30 sec @ 0.5 lpm / (1 cfh)

2.3 Operating

Power requirements:	24VDC, 2.5 Amps max. Use only well-regulated power supply
Outputs:	2 x analog, sourcing, individually isolated, 4 – 20 mA (R<500 Ohm) 4 x digital OUT, 24 VDC, 0.7 A max.
Inputs:	1 x analog, dedicated temperature sensor (optional) 2 x digital, 24 VDC
Working pressure:	ambient +/- 70mbar (1PSI)
Ambient Temperature:	< 57°C (<135°F)
Sampling pump:	Maximum Continuous Vacuum generated 350mbar - abs (5 psi) Maximum Continuous Pressure generated 1.4barg / (20 psig)

2.4 Recommended Calibration

Polynomial calibration	12 months

3 INSTALLATION

3.1 Overview

The *H2Smart*™ unit is to be installed away from the furnace and the sample gases are tapped from the exhaust lines. Ensure that the source and dump lines are at the same pressure. Do not install spanning an oil/water bubbler or other pressure control valves.

CAUTION

The sampling gas temperature entering the *H2Smart*™ must be < 90°C (195F°). Usually this condition is easily accomplished by selecting the proper length and heat dissipation condition of the sampling supply line. Necessary heat dissipation for the sampling flow of 0.5 lpm (1 cfh) and temperature difference 500°C (932°F) is less than 10 W (35 Btu/hr) and depend on the sampling gas composition.

CAUTION

Handle with care, do not drop. The sensor is susceptible to shock, and it is a static sensitive device, use proper handling procedures

CAUTION

Installations with dirty exhausts (powder residues, injections, Malcomizing, masking, furnaces with oil seals) require a supplementary pre-filter. We suggest a 5µm (or as required for your particular condition) with a surface area of not less than 200 cm^2 (30 in^2).

For ferritic nitrocarburizing, we suggest that this pre-filter is also heat traced.

End user must ensure that gases entering the unit are free of contaminants such as water, oil or other.

Always purge the chamber when possible. Consider to “sample” when the furnace is purging to limit the precipitate in the chamber.

3.2 Physical Characteristics

BOTTOM VIEW

SIDE VIEW

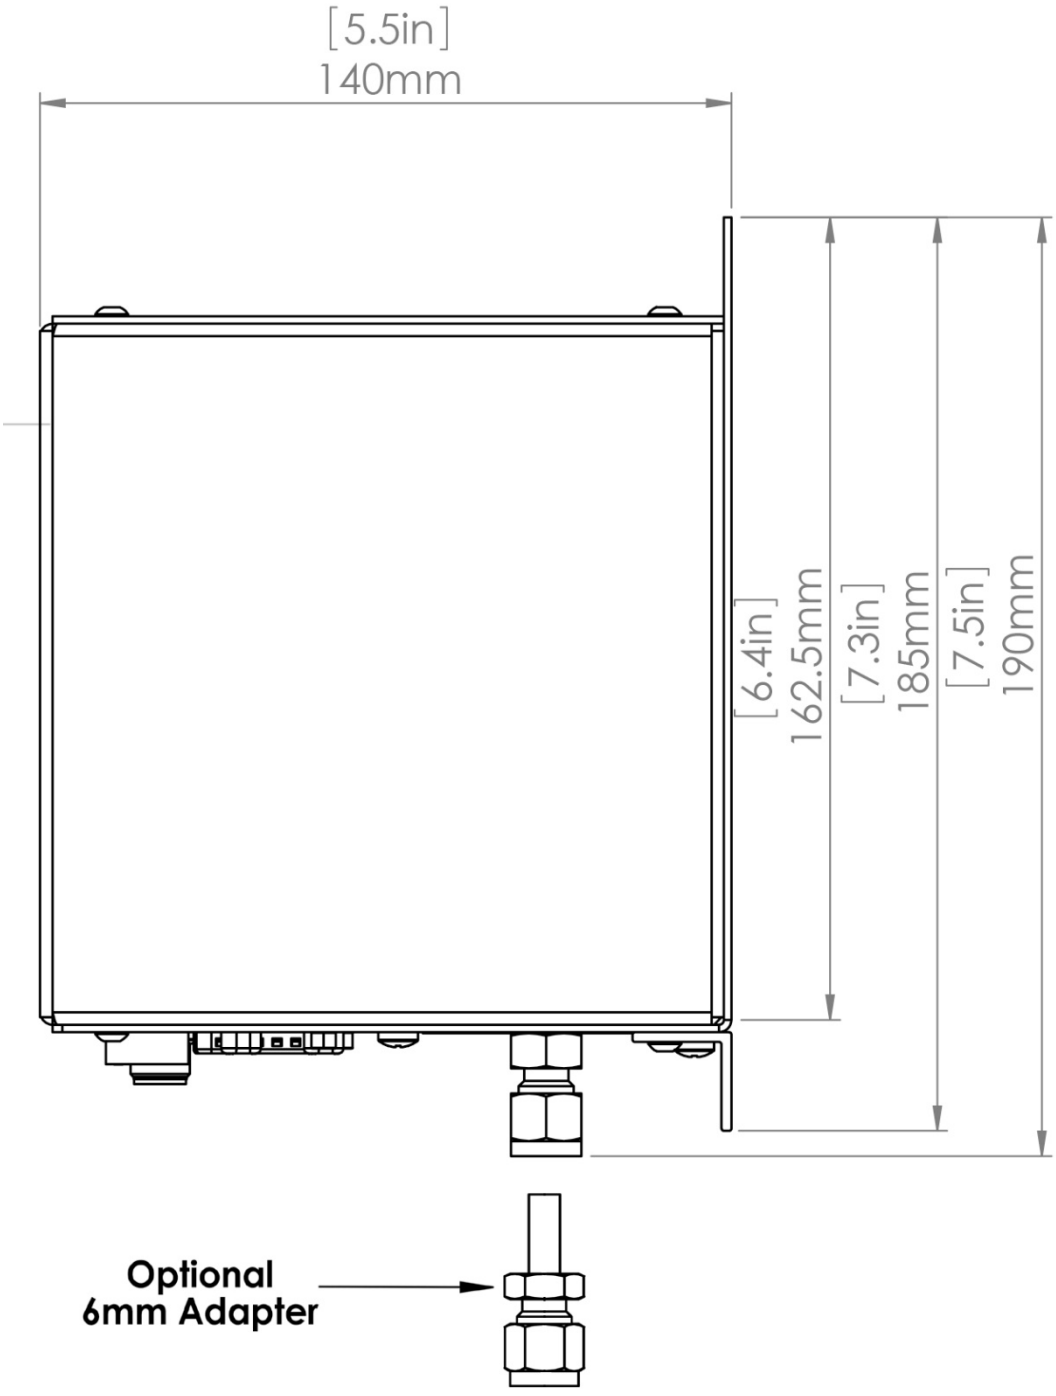

Figure 3 - Side View

3.3 Installations Steps

3.3.1 Step 1

Two support brackets and four screws are used to secure the *H2Smart*™ unit. Attach unit to a panel wall using four #10 (M5) screws

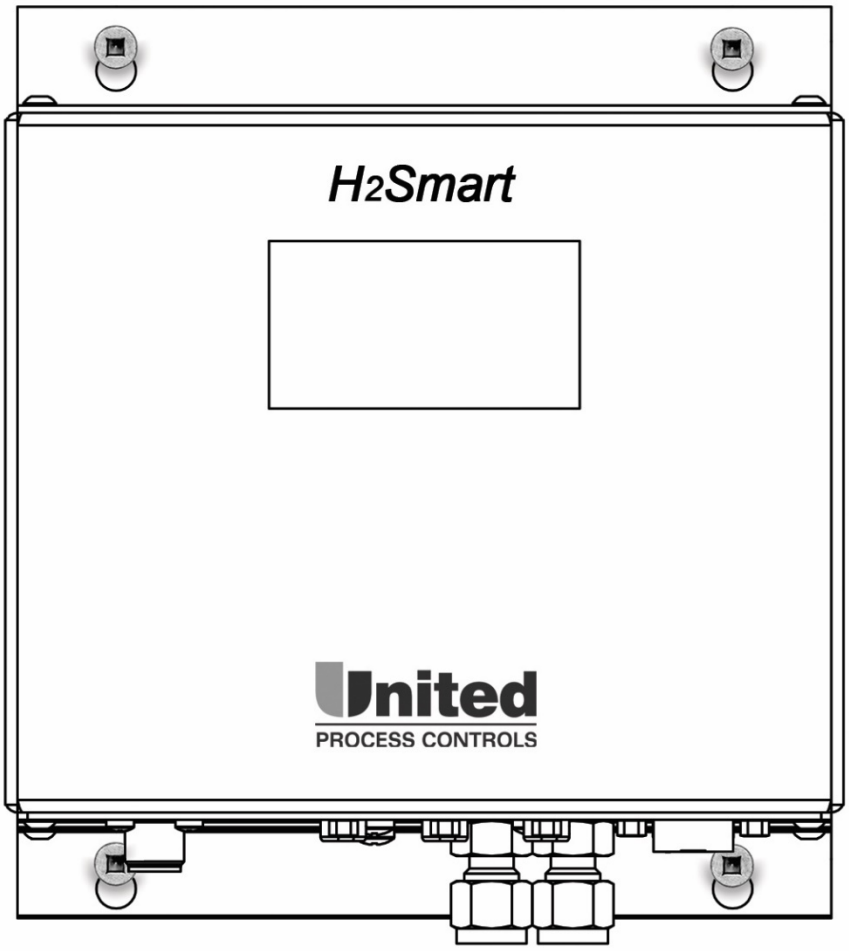

Figure 4 - Step 1

3.3.2 Step 2

Pre-measure and bend the tubing accordingly.

Pre-swage Swagelok ferrules to the tubing's using Swagelok Pre-swaging tool or spare Swagelok fitting

CAUTION
Do not swage the tubing in the *H2Smart*™ connectors!

Attach tubing to Exhaust

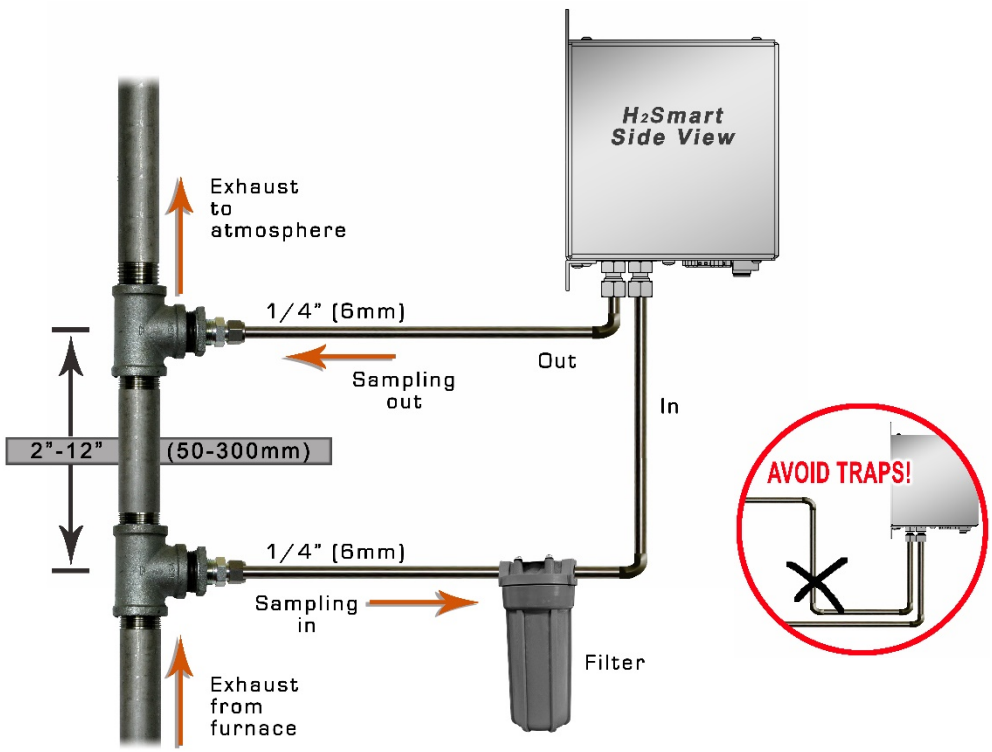

Figure 5 - Step 2

3.3.3 Step 3

Connect 1/4” tubing to Swagelok connector using a 9/16” wrench or metric equivalent - **do not over tighten**

* **Follow Swagelok instruction to assemble piping with tube fitting.**

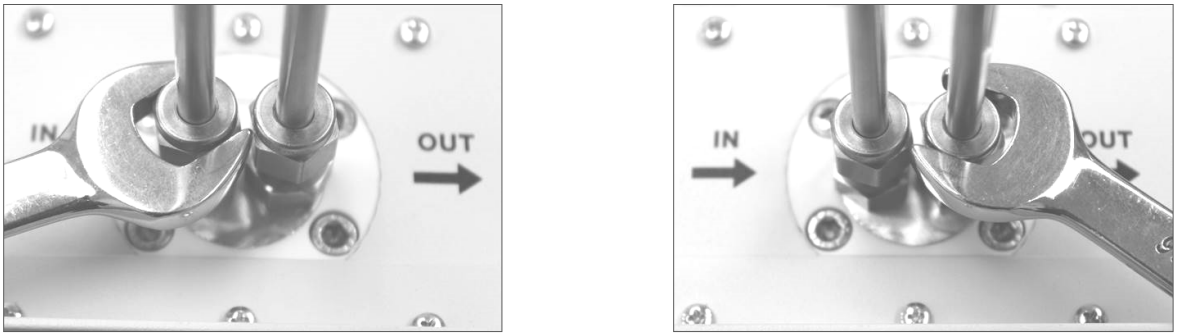

Figure 6 - Step 3

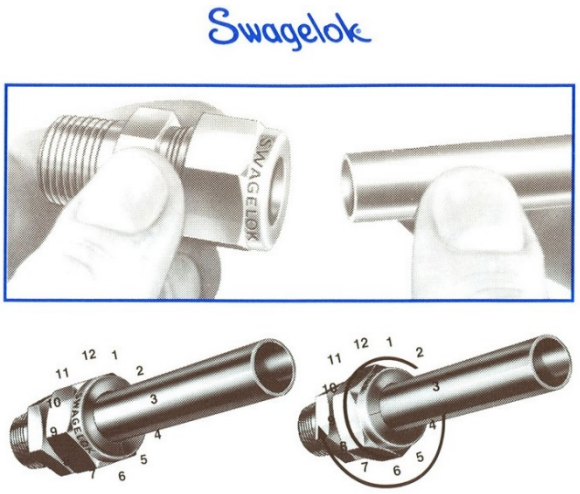

Figure 7 - Step 3

Assembly Instructions

a. Insert tubing into the Swagelok tube fitting
b. Make sure that tubing rests firmly on the shoulder of the tube fitting body and that the nut is finger-tight
c. Scribe the nut at 6 o'clock position
d. While holding fitting body steady, tighten the nut 1 1/4 turns to the 9 o'clock position

Reassembly Instructions

a. Insert tubing with pre-swaged ferrules into fitting body until the front ferrule seats.
b. Rotate the nut with a wrench to the previously pulled-up position. At this point, a significant increase in resistance will be encountered.
c. Tighten slightly with the wrench. Note: don't use the gap inspection gauge with reassembled fittings.

3.3.4 Step 4

Heat tracing the sample gas tubes for Ferritic Nitrocarburizing furnace

In order to avoid clogging of the sample gas tubes by ammonium carbonate and condensation, the sample tubing / piping should be kept at temperatures within the range of 85 – 90ºC (185 - 195°F) by external heat tracing. For this purpose, typically, a heat trace cable is run close to the tube bundle, tightly pressed against the tubes by appropriate cable ties. The whole assembly is then wrapped in thermal insulation material.

Use pipe insulation whenever you run heat tracing!

Try to run the in and out tubing side by side such that the heat tracing sensor and the cable all fit nicely in one tightly packed bundle. This will ease the installation of the insulation and maximize efficiency.

Mount the optional heat tracing temperature sensor to the tube bundle inside the thermal insulation, at a distance of 30 - 60 cm / (1 - 2 ft) from the *H2Smart*™ connectors.
Use an appropriate solid-state relay controlled by the heat tracing control output to switch power to the heat tracing cable.

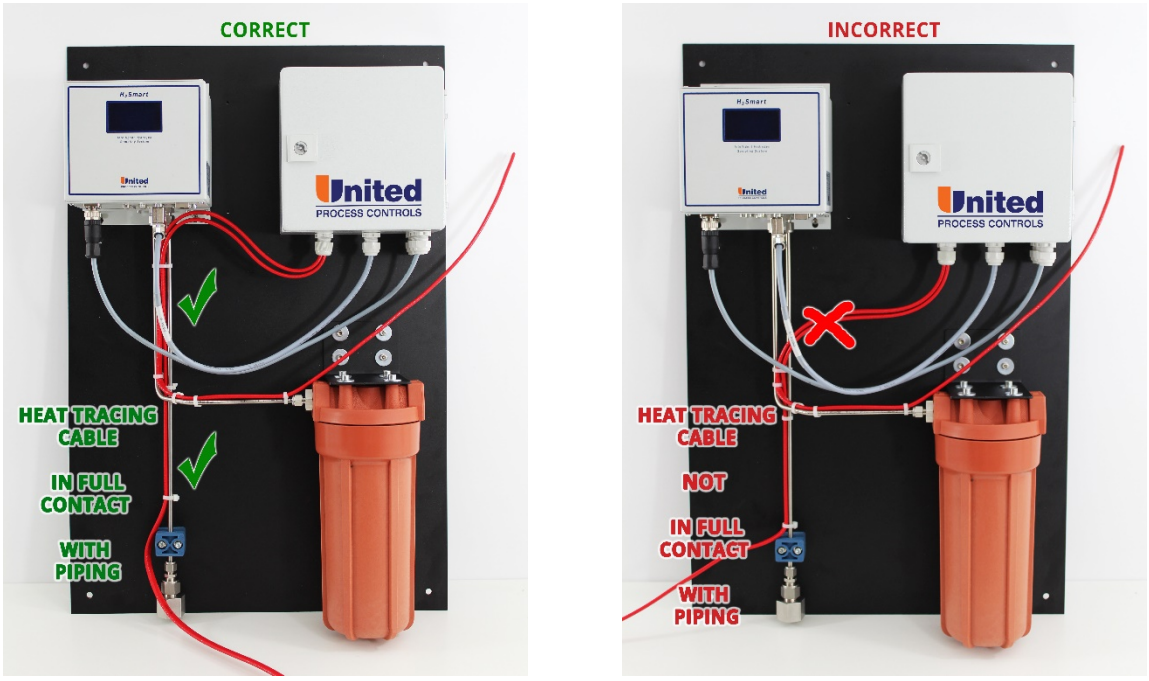
Figure 8 - Step 4

Due to the high probability of “dirty gas”, sharp bends in the piping should be avoided. Try to keep the piping as smooth and as straight as possible as this will aid in the heat tracing / insulation later. Avoid unnecessary **loops, fittings or traps in piping**.

See the wiring diagram section for more information.
The *H2Smart*™ will regulate the heat tracing temperature to 203°F (95°C) as long as it is powered up without further user action.

Important consideration

- Digital I/O’s and *H2Smart*™ main power shall be powered from the same source
- Arrange the heat tracing cables and the temperature sensor as shown
- 15 W/foot (45 W/meter) is good for typical installations with average insulation
- Heating cable has to be placed up to the inlets plate of the *H2Smart*™
- Cable has to heat both (inlet and outlet) connectors
- Thermal insulation shall be **in contact** with inlets plate and be **properly sealed**
- No gap shall exist between inlets plate and the insulation
- Temperature sensor has to be attached to the tubing only, it should not touch the heating cable



Note: Heat tracing insulation not shown
Figure 9 - Heat trace cable installation

4 ELECTRICAL INSTALLATION

Connect the system to a well-regulated 24VDC power supply capable of supplying 2.5A minimum (3A typical).

Connect power cable to 24 V power supply

Figure 10 - Electrical Installation

CAUTION

The *H2Smart™* will be permanently damaged if connected to 115 or 230VAC

Within the specified limits, the value of the supply voltage will not influence the accuracy, but a power supply with bad stability may increase measurement noise of the system. Use a well-regulated power supply and do not operate other heavy loads from the same supply.
The specified power consumption is only true during start-up, after operating temperature is reached, the power consumption will decrease to 20% - 40% of the specified value, depending on ambient temperature.

4.1 Power and Electrical Connections

4.2 Oxygen Probe Connector (Optional Feature – Connector and Add-on Card)

The optional oxygen probe card with high impedance input comes with a user-friendly DB9 connector where you can terminate the mV and TC signal from the oxygen probe using only a precision screwdriver. Move the slider to the right to release, left to grip (as shown in the drawing below).

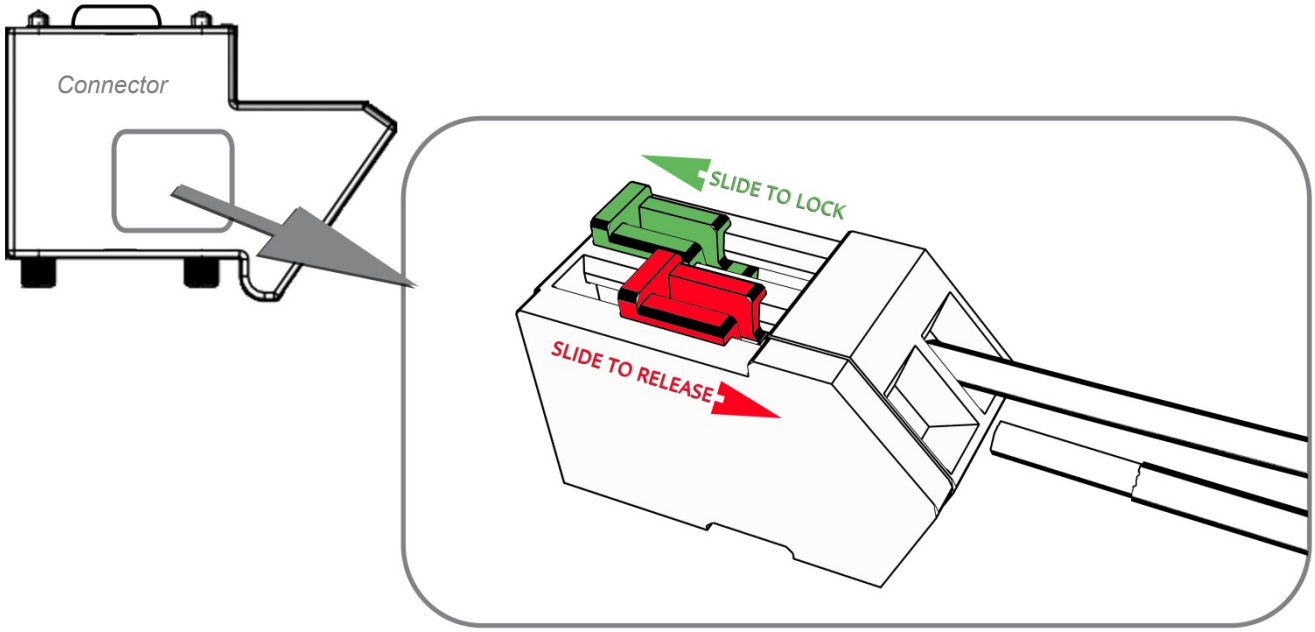

Figure 11 - Probe Connector

PIN	O_2 Probe db9 connector
RED	Probe mV (+)
BLK	Probe mV (-)
GRN	Probe TC (+)
WHT	Probe TC (-)

Note that the *H2Smart™* Oxygen Probe card's thermocouple input can be configured as type K or S. It is crucial to use the webserver to select the appropriate setting.

5 OPERATING INSTRUCTIONS

Connect the system to a well-regulated 24VDC power supply capable of supplying 2.5A. Once power is applied, the system heats up the measuring cell to operational temperatures. Flow measurement is disabled, and the sampling pump is off during heat up to avoid contamination of the system with condensation. Depending on ambient temperature, heat up takes about 30

minutes. Full accuracy is reached after 1h. It is always recommended to keep the system powered up and use the "Sampling enable" digital input or digital communication to activate or deactivate the sampling flow.
When the operating temperature is reached, the "Sampling enable" digital input or digital communication command must be active to start sample gas pump, enable sampling flow control and gas composition measurement.

Display

The display shows the following information, depending on the system status:

Display shows:	Status
Process Variable i.e. % diss., $\%H_2$	Sampling enabled; value is displayed
O_2 Probe mV + Temperature, K_N, Alarms (in order of priority)	If enabled, the mV and temperature is displayed
Ticker	Information such as IP address, FW version and up time.
Wrench symbol	Maintenance is due. See webserver.

K_N and K_C Calculation

The K_N and K_C calculations run internally in the unit based on the furnace volume, the inlet gas flows, and the reading from the *H2Smart*™ sensor. To ensure a correct furnace atmosphere calculation, the process flows into the furnace must be updated whenever they are changed. The updates must be made at all times during the recipe, even during non-nitriding stages. These changes can be made via the communication adaptor (MODBUS, ProfiBus or CANBus). The communication data register assignments can be found in this manual. The furnace atmosphere is continually updated based on the flow rates and the stored furnace volume.

Valid K_N and K_C calculated values require the furnace to be at nitriding temperature, as well as the *H2Smart*™ sampling enabled. When the sampling is disabled, the K_N and K_C calculations are disabled and will return a 0.00 value. If sampling is enabled under non nitriding conditions, the K_N and K_C calculations will not return valid K_N and K_C values.

6 PREVENTIVE CARE

All maintenance and preventive care must be carried out by trained personal only in compliance with the applicable safety standards.

6.1 Sample gas pump

Maintenance period	The life time of the sample gas pump is dependent on the composition of the gas.
Action	Send the unit in for service in case of a pump failure.

WARNING
Prevent liquids such as water or oil from entering the sampling line.

WARNING
Never use sharp objects (wire, screwdriver, etc.) to check or unblock the *H2Smart*™ sampling Swagelok connectors and internal lines. Never use compressed air to clean the *H2Smart*™.
This may create a health hazard and permanent instrument damage.

7 CONFIGURATION (INTEGRATED WEB SERVER)

Using a web browser, navigate to the IP address of the H2Smart. Many parameters can be set / adjusted such as IP address, alarm details, and other user accessible variables. The default access is: u: admin / pw: ammonia

				Bit7: Real time clock malfunction
				Bit8: Storage device malfunction
8	System alarms	Uint	Standard	Bit0: Could not initialize non-volatile configuration service
				Bit1: Could not initialize system supervision service
				Bit2: Could not initialize filesystem
				Bit3: Could not initialize ethernet service
				Bit4: Could not initialize IO service
				Bit5: Could not initialize HTTP server
				Bit6: Could not initialize Modbus server

Input Register	Data	Type	License required	Comments
				Bit7: No filesystem detected
				Bit8: Could not initialize display service
				Bit9: Could not initialize measurement block service
				Bit10: Could not initialize O2 card service
				Bit11: Could not initialize Profibus server
				Bit12: Could not initialize CAN server
			Furnace model	Bit13: Could not initialize furnace model service
			Standard	Bit30: Could not update device's firmware
				Bit31: Empty EEPROM detected
12	IO alarms	Uint	Standard	Bit0: Flow off limits
				Bit1: Pump saturation
				Bit2: Temperature sensor open circuit detected
				Bit3: Block heater failure
				Bit4: Analog output 1 open circuit detected
				Bit5: Analog output 2 open circuit detected
				Bit6: Thermocouple open circuit detected
				Bit7: O2 probe impedance test failure
				Bit8: Block temperature too high
16	H2/Dissociation [%]	Float	Standard	
20	Block temperature [°C]	Float	Standard	
24	Thermocouple temperature [°C]	Float	Standard	Only if o2 card is present
28	O2 probe emf [mV]	Float	Standard	
32	Kn	Float	Nitriding potential	
36	Ko	Float	Nitriding potential	Only if o2 card is present
40	Serial number	Ushort	Standard	
42	Total working hours	Uint	Standard	
46	Hours to next service	Ushort	Standard	
48	Heat tracing temperature [°C]	Float	Standard	
52	Flow rate [l/m]	Float	Standard	
56	Reserved			Reserved
60	Furnace model output: CO content	Float	Furnace model	
64	Furnace model output: CO2 content	Float	Furnace model	
68	Furnace model output: CH4 content	Float	Furnace model	
72	Furnace model output: H2 content	Float	Furnace model	
76	Furnace model output: H2O content	Float	Furnace model	
80	Furnace model output: NH3 content	Float	Furnace model	
84	Furnace model output: N2 content	Float	Furnace model	

Input Register	Data	Type	License required	Comments
88	Furnace model output: O2 content	Float	Furnace model	
92	Furnace model output: Dissociation	Float	Furnace model	
96	Furnace model output: Kn	Float	Furnace model	
100	Furnace model output: Ac	Float	Furnace model	
104	Furnace model output: Ko	Float	Furnace model	
108	Furnace model output: Kc	Float	Furnace model	
112	Furnace model output: LogpO2	Float	Furnace model	
116	Furnace model simplified calculations	Byte	Furnace model	0 = not active, 1 = active

Output Register	Data	Type	License required	Comments
0	Enable sampling request	Byte	Standard	1 = activate
1	Reserved			Reserved
20	Actual gas1 inlet flow [m^3/h]	Float	Furnace model	Profibus input for furnace model
24	Actual gas2 inlet flow [m^3/h]	Float	Furnace model	
28	Actual gas3 inlet flow [m^3/h]	Float	Furnace model	
32	Actual gas4 inlet flow [m^3/h]	Float	Furnace model	
36	Actual gas5 inlet flow [m^3/h]	Float	Furnace model	
40	Actual gas6 inlet flow [m^3/h]	Float	Furnace model	
44	Actual gas7 inlet flow [m^3/h]	Float	Furnace model	
48	Actual gas8 inlet flow [m^3/h]	Float	Furnace model	
52	Furnace temperature [°C]	Float	Furnace model	
56	Reinitialize furnace model calculations	Byte	Furnace model	1 = activate
57	Force simplified model calculations	Byte	Furnace model	1 = activate, 0 = deactivate

Reach us at www.upc-marathon.com

UPC-Marathon brings together leading brands to the heat-treating industry including Atmosphere Engineering, Furnace Control, Marathon Monitors and Process-Electronic, and Waukee Engineering. We provide prime control solutions through our worldwide sales and services network with easy-to-access local support.
